June 27th, 2025

To everyone's approval, the American financial markets are back in summer bionic mode. From the tariff saga to the EU's obsession with Ukraine to the Iran/Israel conflict, the market doesn't give a shit. This has become the theme of 2025 and the market volatility during such has provided nothing but opportunities.

We've written recently about a handful of tickers closest to our heart (HOOD, TEM, TSLA, NGVC, DKNG, EOSE, VG, NVDA) and we will continue to have a focus on these moving forward. I'll include brief thoughts and action items on each below.

DKNG is one we have previously identified as a 2025 swing trade candidate. We entered this trade at $35.39/share on May 28th and subsequently exited on June 25th at $43.11 (21.8%). *You think to yourself, why can't I do that a half dozen more times and call it a year?* I'm of the belief DKNG will continue to provide these chances. We will see this name pull back to the $35-38 range and it will again be a prime target for swing trading. As mentioned before, I'd like to see this one chop around its MAs before eventually proceeding to $50/share sometime later this year.

DKNG at market close on June 26th

HOOD & TEM are two names I've been extremely bullish on over the last year or so. Both are at the forefront of current market thematics and one doesn't have to be a genius to realize this. *Something I've learned through the years is to not take lightly as to who is leading the pack*. Recently HOOD has been the dominant of the two, as it continues the climb to $100/share. Looking back, HOOD is a textbook example of what to look for in a post-IPO growth stock. In the below image you can see the two-year "Stage 1" basing phase that hit HOOD like a train. You've got massive amounts of pre-seed investors selling their stock and with an IPO market cap of $32B, that can take years to filter out. Not to mention, this was the pop in the Covid bubble that led to an aggressive rerating across all technology stocks. Gleefully, at the beginning of 2024 you begin to see institutional money come flying into the stock. This is the wave that you as a retail investor have to position yourself in front of. This begins the "Stage 2" growth phase that entails a significant multiple expansion and rerating across the board. Even still today, HOOD has <60% institutional ownership alongside a ~13% insider ownership amount.

HOOD at market close on June 26th

HOOD is still in the meat of that growth phase and we've made recent comments on our belief it continues. Financially and fundamentally, HOOD has turned into a darling in my opinion. Yes.. they have regulatory agencies paid off, the market makers paid off, and anyone in between paid off. Some would call that a barrier to entry, others would call it illegal. In our predatory capitalistic economy, it's never going to be stopped. Recognizing this one fact you can begin to grasp that HOOD will continue to be a major winner in the years to come. I used to despise the founders of HOOD back in 2018-2019, but I've since come around on them as they have executed to perfection. Not only that, their product is truly great.

As for TEM, this stock is much younger and is at the vanguard of two major themes driving the current market (Biotech/AI). Not only is this stock extremely politically tied, it has the ownership structure that I so often look for in growth stocks. These are prime targets for young investors to have stored away in tax advantaged accounts. TEM is heavily owned (26%) by their founder and current CEO. In total, insiders own over 40% of this company with institutions owning just over 38%. We want to be buyers at this level and still be holding when institutional ownership is >80%. That is the tsunami of growth that we intend to front run in the long term. While we will be present for the long term, we can also trade this volatile name in the short term. I'd like to enter a swing trade soon at or below $60/share and trade it back north of $80/share this year.

NGVC is a lesser known ticker to many people in today's market but it is one I'm most fond of. Again, I can't stress the ownership structure bias here enough. The Isley family owns roughly 40% of this company and they oversee all operations as well. I've compared this set up before to that of a younger SFM and CASY, both of which have outperformed most every stock in the last five years. I have written extensively about them this year and I will continue to do so as I think the recent sector rotation has provided long term investors with a great entry. I'm already invested in NGVC with an average cost around $41/share. I'm planning to add substantially to this (2-3x) if the stock touches the $28-32/share range. At that point, I'll quit watching and we will enjoy the subsequent rise over the next few years.

Again, as a young investor, storing this name away in a tax advantaged account is the ideal way to play the game. With a market cap below $1B, there is tremendous growth potential here.

VG is one we know well and can surely approach with a long term perspective. IPO'ing at over a $60B market cap, VG quickly saw blood shed and entered what I mentioned earlier as the "basing" phase. As an investor with conviction in the name, you can only beg for it to stay put during this phase so you can continue to load the boat. This company is majority owned by the two founders via a dual class share structure vehicle, Venture Global Partners II, LLC. This allows them certain controlling advantages but a simple guy like myself can feel assured they eat their own cooking. With the nuclear sector on a run and mounting Middle East tensions, VG has enjoyed a nice run over the last month. We can only hope that it trends back to the $10/share range for more long term investors to load the boat. One important thing to note is the lockup expiry occurring on *July 27th for pre-IPO investors in VG*. I'm going to be watching the name closely over the next few months in order to get positioned properly for the long term. There are a few certainties with this name...America has endless natural gas supplies…We are investing heavily into the LNG exporting industry…and even then we are well under global demand levels. It's a catchup game that we simply won't achieve. As long as the EU environmentalists continue to crater their energy industry, America will be supplying them all with LNG for many decades to come.

EOSE is a name I've been following roughly the last year or so. I've recently begun writing about it and recommending it this year. This is a name that thematically is perfectly positioned. If you haven't been awake, energy and the ensuing demand is a hot idea across the market. EOSE finds itself within the walls of clean energy, growing domestic energy demand, AI, etc. That is what I mean by thematically perfect. Secondly, as we can tell from the below visual, we have a stock that is approaching the "growth" phase after just briefly breaking out of its multi-year "basing" phase.

EOSE at market close on June 27th

Now I'm not recommending someone to recklessly dump money they can't lose into this name, because as I've written before, this is a very volatile name and we have to be fine if we wake up and she's gapped down 30%. But I am recommending this name to those who have the appetite for that and don't immediately need their money back. At current levels around $4.40 and hugging the 50 day MA, I'm fine with starting a position in hopes of riding this wave. I'm aboard for the long term as well here.

To conclude this writing, of course we have to mention a market leader in ***NVDA*** and our sour dog in ***TSLA***. When we see these goliaths making gains, it is mathematically impossible for the market to do anything other than rise daily. These names hold such a weight across the market that we can get most of our sense for short term market movements from just watching their price action alone (NVDA much more so than '25 TSLA). *We see a pull back like in April… what's the first name money rushes into? NVDA.* Any time we have a brief dip amid a bull market, you can guarantee the big boys are hitting NVDA first and foremost. Now for TSLA, as we know, we have been heavily allocated to TSLA this year from $275/share range and have reaped the rewards although we experienced a brutal flash crash during Elon/Trump's online saga. Luckily, we've been selling around $350/share. I've not lost any conviction on the name, it's just that my appetite has changed slightly. I still believe the ticker is extremely cult-like and by that I mean unmeasurably volatile. We can wake up tomorrow and it trades at $225/share, or it could be at $400/share by week's end. That alone makes most players uncomfortable. With the right entry point, this one can be a huge winner, but it's going to take stomaching all of the noise in between. I've since reduced my holding in TSLA and intend to keep it depressed for the time being. I'd like to see another opportunity present itself around $300/share.
